AOC-QSFP14-QSFP14-OM3-aaa.aaM

56Gb/s QSFP+ Active Optical Cable

AOC-QSFP14-QSFP14-OM3-aaa.aaM Overview

AOC-QSFP14-QSFP14-OM3-aaa.aaM QSFP+ AOC is a 4-channel active optical cable for 40G Ethernet applications that is designed to meet the QSFP+ 14Gbps 4X Pluggable Transceiver SFF-8436 specification. This full-duplex optical assembly offers 4 independent transmit and receive channels, each capable of 14Gbps operation for an aggregate bandwidth of 56Gbps.

The cables use the standard multimode fiber cable carrying a nominal wavelength of 850nm. The electrical interface uses a standard 38 contact edge type connector and is electrically compliant with the SFI+ and PPI interface supporting Infiniband, Ethernet, Fiber Channel. The connector is hot pluggable and provides I2C serial access via an on-board microcontroller. QSFP+ AOC can be used as a direct replacement for traditional copper cables with the added benefit of a lighter weight and smaller diameter solution for cable lengths from 1 to 100 meters.

Product Features

- 4 high-speed full duplex channels
- QSFP+ MSA compliant
- Built-in digital diagnostic functions
- Cable lengths from 1 to 100 meters
- Low power consumption, less than 1W per cable end
- RoHS 6 compliant
- Operating temperature range: 0°C to 70°C

Applications

- 40G Ethernet
- 4G/8G/10G/14G Fibre Channel
- InfiniBand 4xFDR, 4xQDR
- HPC Interconnections
- SATA/SAS3

Functions Description

The QSFP AOC has miniature optical engines embedded into each end of the cable assembly. The engines interconnect 4 independent transmit/receive lanes.

A functional block diagram of the engine is shown in the above figure. The transmitter section consists of a 4-channel VCSEL array, a 4-channel input buffer and laser driver.

An on board micro-controller provides control, diagnostic and monitoring for the cable functions, as well as the external I2C serial communication interface.

The receiver section consists of a 4-channel PIN photodiode array, a 4-channel TIA array, and a 4-channel output buffer.

Notes:

1. ModSelL is the input pin. The module responds to 2-wire serial communication commands when it is held low by the host. ModSelL allows multiple QSFP modules to be used on a single 2-wire interface bus. If ModSelL is High, the module will not respond to any 2-wire interface communication from the host. ModSelL has internal pull-up resistors in the module
2. The module restart pin, when the low level on the ResetL pin lasts longer than the minimum pulse length, resets the module and restores all user modules to their default state. When performing reset device, the host should ignore all status bits. Until the module reset interrupt is completed, please note that during hot plugging, the module will issue this information to complete the reset interrupt without resetting
3. This pin is active high, indicating that the module is running under a low power module.
4. IntL is the output pin, which is the open collector output and must be pulled up to Vcc on the motherboard. When it is low, it indicates that the module may malfunction. The host uses a 2-wire serial interface to identify the interrupt source
5. Circuit ground is internally isolated from chassis ground.
